Abstracts

An air monitoring station is a fixed or mobile facility equipped with specialized instruments and sensors designed to measure and record concentrations of various air pollutants and meteorological parameters in real-time or at regular intervals, providing critical data on air quality for regulatory compliance, public health advisories, and environmental research. These stations typically monitor pollutants such as particulate matter (PM_{2.5} and PM₁₀), nitrogen oxides (NO_x), sulfur dioxide (SO₂), carbon monoxide (CO), ozone (O₃), and volatile organic compounds (VOCs), often integrating weather sensors to track wind speed, direction, temperature, and humidity, which help in understanding pollutant dispersion and sources. The data collected is used by government agencies, research institutions, and industries to assess compliance with air quality standards, inform policy decisions, issue health alerts, and support scientific studies on atmospheric chemistry and climate change.

The global Air Monitoring Station market size was estimated at USD 1024.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
