Abstracts

An air operated squeeze valve, also known as a pneumatic pinch valve, is a type of flow control device designed to regulate the passage of fluids or semi-solids through a flexible elastomeric sleeve or tube by compressing it with an external pneumatic actuator. The valve operates by applying compressed air to a mechanism that pinches the sleeve shut, thereby stopping flow, and releasing the air to allow the sleeve to return to its open position, facilitating unimpeded flow. This design eliminates the need for seals, glands, or internal obstructions, making it particularly suitable for handling abrasive, corrosive, viscous, or shear-sensitive media, as well as applications requiring sterile or contamination-free conditions, such as in pharmaceutical, food and beverage, mining, wastewater treatment, and chemical processing industries.

The global Air Operated Squeeze Valve market size was estimated at USD 680.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
