Report Overview

A pool heat pump is a simple and energy-efficient way to keep your pool or spa water warm all year round. But unlike a gas or electric pool heater, it doesn't actually generate heat. Instead, it pulls warmth from the air outside and uses it to heat your pool water. Here's how it works. When your heat pump is on, a fan draws warm air into the heat pump's evaporator coil. The air heats up the liquid refrigerant inside, turning it into a gas. The gas then passes through a compressor that heats it further. Once it reaches a certain temperature, it moves into the heat exchanger (a tube within a tube) and heats up your pool water. When this is done, the water returns to your pool and the gas goes back to liquid form and starts the process all over again.
