Abstracts

An air supported fabric dome is a large, enclosed structure constructed from high-strength, flexible membrane materials such as PVC-coated polyester or ETFE, which is supported and maintained in shape by a continuous flow of pressurized air from specialized inflation systems. These structures rely on a slight positive internal air pressure to remain rigid and stable, eliminating the need for traditional internal supports like beams or columns and enabling vast, column-free interior spaces. Commonly used for sports facilities, event venues, temporary storage, agricultural buildings, and emergency shelters, they offer advantages in rapid deployment, cost-efficiency compared to permanent construction, natural light transmission, and adaptability to various climates and site conditions. Key design considerations include airlock entry systems to maintain internal pressure, robust anchoring to resist wind and snow loads, energy efficiency of the inflation equipment, and durability of the fabric against UV degradation, tearing, and environmental stressors.

The global Air Supported Fabric Dome market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
