## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Air Traffic Control Secondary Surveillance Radar competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Air Traffic Control Secondary Surveillance Radar (ATC SSR) is a critical component of air traffic management systems, designed to enhance situational awareness by actively querying and receiving responses from aircraft transponders. Unlike Primary Surveillance Radar (PSR), which detects aircraft by reflecting radio waves off their surfaces, SSR relies on a two-way communication process between ground-based radar systems and onboard transponders, providing more detailed and reliable aircraft information. ATC SSR operates through a coordinated interaction between a ground interrogator and aircraft transponders:

1. Ground Interrogator: Transmits encoded radio frequency (RF) signals (typically in the 1030 MHz band) to query aircraft within its coverage area.
2. Aircraft Transponder: Receives the interrogation signal and transmits a response (in the 1090 MHz band) containing specific aircraft data, such as:
  - Mode A: A 4-digit octal code (e.g., 1200) for general identification, used in non-radar or basic surveillance areas.
  - Mode C: Automatically reports the aircraft's altitude (in 100-foot increments), enabling controllers to monitor vertical positioning.
  - Mode S: A more advanced digital mode that provides unique aircraft identification (24-bit address), enhanced data capacity (e.g., velocity, heading), and supports selective interrogation (to avoid signal interference in dense airspace).

The global Air Traffic Control Secondary Surveillance Radar market size was estimated at USD 1643.0 million in 2025 and is projected to grow at a compound annual growth

rate (CAGR) of 13.30% during the forecast period.
