Abstracts

An Airborne 3D Laser Scanning System is a sophisticated technology used to capture high-resolution, three-dimensional spatial data of large geographical areas from an aerial platform, such as an aircraft, helicopter, or drone. This system employs LiDAR (Light Detection and Ranging) technology, which uses laser pulses to measure distances to the Earth's surface and other objects. The laser pulses are emitted and then reflected back to the scanner, where the time it takes for each pulse to return is recorded and converted into distance measurements. With multiple sensors and positioning equipment, like GPS and Inertial Measurement Units (IMUs), airborne 3D laser scanning systems produce highly accurate 3D models and digital elevation models (DEMs) of the scanned areas.

The global Airborne 3D Laser Scanning System market size was estimated at USD 696.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
