Abstracts

Airborne mapping solutions refer to a set of technologies and systems that use aircraft (including manned aircraft and UAVs) as carriers to carry various sensors, collect geospatial data, and generate high - accuracy maps. It mainly relies on sensors such as lidar and high - resolution cameras to collect data. Lidar emits laser pulses to measure the distance between the sensor and the ground object, and obtains high - density point cloud data to reflect the terrain and ground object features. The camera takes a large number of aerial photos, and through photogrammetry technology, the photos are processed to generate orthophotos and digital terrain models. At the same time, the GNSS - aided direct georeferencing system is used to ensure the accuracy of data positioning, so that the collected data can be accurately positioned in the geographic coordinate system.

The global Airborne Mapping Solutions market size was estimated at USD 2287.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.70% during the forecast period.
