Abstracts

Aircraft anti-icing fluid is a specialized chemical solution applied to the external surfaces of aircraft, primarily wings, tail, and control surfaces, before takeoff during winter weather conditions to prevent the accumulation of ice, frost, or snow. These fluids are formulated with glycol-based compounds?most commonly propylene glycol or ethylene glycol?combined with thickening agents, corrosion inhibitors, and water to create a viscous, freeze-resistant layer that adheres to aircraft surfaces. The performance of these fluids is rigorously standardized under international regulations, such as those set by SAE International (e.g., SAE AMS 1424 and AMS 1428), which classify them into four types (Type I through IV) based on their holdover time?the duration they remain effective under specific weather conditions like snowfall intensity and temperature. Type I fluids are unthickened and designed for quick removal during takeoff, while Type II, III, and IV are thickened to provide extended protection on ground hold and during taxiing. The primary function is to ensure flight safety by maintaining aerodynamic integrity and preventing ice-related control issues, making these fluids a critical operational input for airlines, airports, and ground handling services in cold climates.

The global Aircraft Anti Icing Fluid market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
