### Report Overview:

Aircraft Arresting System is a mechanical system used to rapidly decelerate an aircraft as it lands. Typical systems consist of several steel wire ropes laid across the aircraft landing area, designed to be caught by an aircraft's tailhook. During a normal arrestment, the tailhook engages the wire and the aircraft's kinetic energy is transferred to hydraulic damping systems attached below the carrier deck. There are other related systems which use nets to catch aircraft wings or landing gear. These barricade and barrier systems are only used for emergency arrestments for aircraft without operable tailhooks

The Global Aircraft Arresting System Market Size was estimated at USD 800.04 million in 2023 and is projected to reach USD 989.17 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
