Report Overview:

Aircraft braking systems include:

Aircraft disc brakes in the landing gear, used to brake the wheels while touching the ground. These brakes are operated hydraulically or pneumatically. In most modern aircraft they are activated by the top section of the rudder pedals ("toe brakes"). In some older aircraft the bottom section is used instead ("heel brakes"). Levers are used in a few aircraft. Most aircraft are capable of differential braking.

Thrust reversers, that allow thrust from the engines to be used to slow the aircraft.

Air brakes, dedicated flight control surfaces that work by increasing drag.

The Global Aircraft Braking Systems Market Size was estimated at USD 6140.86 million in 2023 and is projected to reach USD 8419.24 million by 2029, exhibiting a CAGR of 5.40% during the forecast period.
