Abstracts

An aircraft corrosion inhibitor is a specialized chemical formulation designed explicitly for the aviation industry. It functions by forming a highly - adherent and impermeable protective film on the surfaces of aircraft metallic components. This film acts as a physical barrier, separating the metal from corrosive agents such as moisture, oxygen, and airborne contaminants. Additionally, it may interfere with the electrochemical processes that lead to corrosion, either by inhibiting the anodic dissolution of the metal or the cathodic reduction reactions. By doing so, it effectively retards the corrosion rate of aircraft parts, safeguarding the structural integrity of the aircraft, extending the lifespan of its components, and ensuring the overall safety and reliability of the aircraft during both flight operations and periods of storage.

The global Aircraft Corrosion Inhibitor market size was estimated at USD 274.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
