Abstracts

Aircraft de-icing systems are critical safety mechanisms designed to remove or prevent the accumulation of ice on aircraft surfaces?such as wings, tail, engines, and propellers?during flight or ground operations, particularly in cold and humid conditions where ice formation can compromise aerodynamic performance, increase weight, and potentially lead to hazardous situations; these systems are broadly categorized into two types: anti-icing systems, which proactively prevent ice buildup using heated surfaces or chemical fluids, and de-icing systems, which remove ice after it has formed, often through pneumatic boots, thermal methods, or fluid applications, ensuring compliance with stringent aviation safety regulations and operational standards in both commercial and military aviation sectors.

The global Aircraft De Ice System market size was estimated at USD 650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
