Abstracts

Aircraft de-icing fluids are specialized chemical solutions applied to aircraft surfaces to remove and prevent the accumulation of ice, snow, or frost, which can compromise aerodynamic performance and flight safety. These fluids are categorized into two primary types: Type I fluids, which are typically orange and used for de-icing (removing existing frozen contaminants), and Type IV fluids, which are usually green and applied as anti-icing agents to delay ice formation for a certain holdover time. Formulated with glycol-based compounds (such as propylene or ethylene glycol), along with thickening agents, corrosion inhibitors, and wetting agents, these products must meet stringent international standards, including those set by SAE International and aviation regulatory bodies, to ensure effectiveness, environmental compatibility, and operational reliability in extreme weather conditions.

The global Aircraft De Icing Fluids market size was estimated at USD 874.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
