Report Overview

According to whether the sealing surfaces are sliding or rotating, dynamic seals can be divided into two basic types: reciprocating seals and rotary seals. According to whether the seal is in contact with the relative moving parts or not, it can be divided into three types of seals: contact type, non-contact type and no shaft seal. The combined seal is a combination of contact seals or non-contact seals to meet higher sealing requirements. Generally speaking, the sealing surfaces of contact seals are close to each other, contact, or even embedded to reduce or eliminate the gap to achieve sealing. Therefore, the sealing performance is good, but limited by friction and wear, it is suitable for occasions where the linear speed of the sealing surface is low. The seals of the non-contact seal are not in direct contact, and a fixed assembly gap is reserved, so there is no mechanical friction and wear. The seal has a long service life, but its sealing performance is poor, and it is suitable for high-speed applications.
