### Report Overview

Aircraft hydraulic pumps are used to move non-compressible fluid through an aircraft hydraulic system. This power is often used on small airplanes to operate wheel brakes, retractable landing gear, and some constant-speed propellers. On large airplanes, hydraulics are used for flight control surfaces, wing flaps, spoilers, and other systems. Aircraft hydraulic pumps are normally engine driven, but sometimes to simplify the system manufacturers use an electric motor to drive the hydraulic system. These hydraulic power packs incorporate a reservoir, control valve and auxiliary valves into a single unit.
