Abstracts

Aircraft landing wheels, also known as landing gear wheels, are specialized components integral to an aircraft's landing system, designed to support the weight of the aircraft during ground operations, takeoff, and landing, while absorbing kinetic energy and dissipating it through friction and braking mechanisms. These wheels are typically constructed from high-strength materials such as forged aluminum, titanium, or composite alloys to withstand extreme loads, temperatures, and stress, and are equipped with tubeless radial tires filled with nitrogen to minimize oxidation and pressure variations at high altitudes. Key subsystems include the wheel assembly itself, brakes, axles, tires, and sometimes anti-skid or carbon brake systems, all engineered to meet stringent aviation safety standards and operational requirements across commercial, military, and general aviation sectors.

The global Aircraft Landing Wheel market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
