Report Overview

Aircraft Micro Turbine Engine is a small-sized combustion turbine that utilizes micro combustion to offer cogeneration to utilize heat & electricity at the same time. Micro turbine engines are preferred due to its features such as utilization of a variety of fuels, small size, and efficiency. As aircraft micro engines are compact, they utilize very small space to fit in and save space for other components in design. Its cogeneration option offers combined usage of electricity and heat from engine for up to 85% efficiency, in case of point-of-power utilization, depending on the heat process requirements. In addition, its low-cost energy makes it cheaper for long term use. Aircraft micro turbine engines are more efficient over reciprocating engines as they not only save space but also offer lubricant oil & coolant free operation. Latest developments in the micro turbine industry pave the way for drone propulsion in military and aviation.

The global Aircraft Micro Turbine Engines market size was estimated at USD 85.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.65% during the forecast period.
