Report Overview:

Aircraft and Marine Turbochargers, colloquially known as a turbo used in Aircraft and Marine, is a turbine-driven forced induction device that increases an internal combustion engine's efficiency and power output by forcing extra compressed air into the combustion chamber. This improvement over a naturally aspirated engine's power output is due to the fact that the compressor can force more air—and proportionately more fuel—into the combustion chamber than atmospheric pressure (and for that matter, ram air intakes) alone.

The Global Aircraft and Marine Turbochargers Market Size was estimated at USD 279.88 million in 2023 and is projected to reach USD 307.85 million by 2029, exhibiting a CAGR of 1.60% during the forecast period.
