Abstracts

Aircraft reverse thrusters, also known as thrust reversers, are integral systems installed on jet engines that temporarily redirect engine exhaust forward during landing to assist in deceleration, thereby reducing wear on wheel brakes and shortening required runway distances. These mechanisms are critical for operational safety and efficiency, particularly under adverse conditions such as wet or icy runways, and are standard on commercial airliners, military transport aircraft, and large business jets. The technology varies by engine type with target, cascade, and clamshell designs among common implementations and is subject to stringent regulatory standards governing deployment protocols, maintenance, and performance to ensure reliability and compatibility with global aviation safety requirements.

The global Aircraft Reverse Thruster market size was estimated at USD 1820.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
