Abstracts

Aircraft floor panels are those panels or boards that are mounted to the aircraft's floor beams to provide a surface for passengers and crew to walk on and provide attachment points for certain furnishings and other components. As floor panels are a component of an aircraft's primary structure, they have more of a role than simply providing a flat surface to walk on. They are important for the overall safety of an aircraft during its normal operations, bearing high loads and resisting impact. Most floor panels have common components, each adding functionality to the overall panel performance. They are usually made from honeycomb sandwich panels with faces consisting of different pre-impregnated glass and cole fibres. The amount of this pre-impregnated material, the direction of each layer and the honeycomb core (the type of paper used and thickness) all have a small influence on the panel's technical properties. A thermic pressing compounds all the materials with resin, followed by a final deep-frying of the panel. This is followed by a hardening process to ensure enduring product quality. Inserts are installed in the panel to provide a means of attaching the panel to the airframe. Most panels include edge fillers, which help prevent liquids from getting into the panel structure and reducing its durability. With increasing demand for choice, airlines are taking advantage of cabin configurations to differentiate from their competition and improve revenues with premium seating. Facilitating multiple configurations without changing panels requires panel design with the versatility to meet all configurations. This means more inserts, and typically more weight to the panel, and more areas of potential failure. Another role, primarily used in business jets, is the need for floor panels to have high conductivity, which is needed to create an electromagnetic shield in the cabin. This allows the use of portable electronic devices in the cabin without interfering with the operation of the aircraft. To meet these challenges, Comtek has developed lightweight inserts and a processing technology that consistently produces a high-strength bond between the insert and the panel that resists degradation from

environmental effects. These lightweight inserts have since been incorporated on now-active aircraft programs and can be tailored to new applications. Comtek also has a high conductivity solution that far exceeds typical aircraft level EMC requirements.

The global Airplane Floor Panel market size was estimated at USD 1470.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
