Report Overview
Radio-Frequency Identification (RFID) uses radio waves to read and capture stored information on a tag attached to an object. A tag attached to an object can be detected from several feet away and does not need to be within the direct line-of-sight of the reader instrument. The RFID system is significantly used in airports for baggage handling, material management, and others. RFID tags are used to enhance the ability for baggage tracking, dispatching, and conveyance; indirectly it improves the airport management efficiency and passenger satisfaction.
North America dominates the airport RFID system market due to the increased application of RFID in baggage tracking, flyable parts tracking, and inventory management in airports. The region is projected to grow at a faster rate due to rise in expenditure on RFID technologies. The U.S. has a very high demand for RFID system for airport applications.
