## Abstracts

AI ECDIS System is a combination of the Electronic Chart Display and Information System (ECDIS) and artificial intelligence technology. The traditional ECDIS system is mainly used to store and display electronic chart information to assist ship navigation, providing functions such as route design, ship position monitoring, and danger warning. After integrating artificial intelligence technology, this system has been significantly upgraded. It can use machine - learning algorithms to conduct in - depth analysis of massive nautical data and accurately predict complex and changeable marine environments, such as tides, ocean currents, and weather conditions, enabling ships to make preparations in advance. During the voyage, the artificial intelligence ECDIS system can independently plan the optimal route based on real - time data and historical experience, avoid potential dangerous areas, and dynamically adjust the route to adapt to unexpected situations. In addition, the system can conduct real - time monitoring and intelligent diagnosis of the operating status of ship equipment, detect potential equipment failures in advance, and reduce the operational risks of ships. In terms of ship traffic management, it can effectively avoid collision accidents by intelligently identifying and analyzing the dynamics of surrounding ships, thereby improving navigation safety and efficiency.

The global AI ECDIS System market size was estimated at USD 395.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
