Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alcohol Ester Coalescing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alcohol Ester Coalescing Agents are a class of high-boiling-point organic compounds used in water-based coatings. Dodecyl alcohol ester is the most typical and widely used coalescent. Its core function is to effectively lower the minimum film-forming temperature of the emulsion, enabling water-based coatings to form continuous, dense, and smooth films at lower temperatures. They are widely considered low-toxic, environmentally friendly "green solvents." The primary raw material for alcohol ester coalescents is isobutyraldehyde, and the supplier concentration is high. Fluctuations in upstream supply and demand, as well as price fluctuations, can significantly impact the production costs and stability of midstream companies. Architectural coatings are the largest application area for coalescents, with the increasing popularity of water-based coatings being the primary driver. Stringent environmental protection policies globally and in China are driving demand for alcohol ester coalescents. Global sales in 2024 are expected to be approximately 148,000 tons, with an average market price of approximately \$1,900 per ton. Single-line production capacity varies depending on the production process and investment in the production facility, typically ranging from 3,000 to 10,000 tons per year, with industry gross profit margins ranging from 10% to 25%.

The global Alcohol Ester Coalescing Agent market size was estimated at USD 281.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
