Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alcohol Ether Coalescing Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alcohol Ether Coalescing Agents are low-volatility/low-odor organic solvent additives formed by etherification or esterification of alcohols or polyols (such as propylene glycol, neopentyl glycol, ethylene glycol) with fatty acids. They are mainly used in water-based emulsion systems to lower the minimum film-forming temperature of the emulsion, promote particle bonding, and improve leveling, gloss, and surface integrity. Its core raw materials primarily include propylene oxide, ethylene oxide, and acetic acid. Propylene oxide is a key raw material for the production of propylene glycol ether-based coalescents. Fluctuations in raw material supply and demand, as well as price fluctuations, significantly impact the production cost and stability of midstream coalescents. Fluctuations in downstream demand for water-based coatings directly determine the market capacity. Global sales in 2024 were expected to be approximately 288,000 tons, with an average market price of approximately US\$1,500 per ton. Single-line production capacity varies depending on the production process and investment in production equipment, typically ranging from 3,000 to 10,000 tons per year, with industry gross profit margins ranging from 10% to 25%.

The global Alcohol Ether Coalescing Agent market size was estimated at USD 432.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
