Abstracts

An alcohol refractometer is an optical instrument used to measure the concentration of alcohol in a liquid solution by determining its refractive index—a physical property that changes predictably with the concentration of dissolved substances like ethanol. It operates by passing light through a sample placed on a prism; the degree to which the light bends is then correlated to alcohol content via a calibrated scale, providing rapid, non-destructive, and reagent-free analysis. These devices are widely employed in the brewing, distilling, and wine-making industries to monitor fermentation progress, verify final product strength, and ensure consistency, while also finding applications in laboratories and quality control settings where ease of use, portability, and immediate results are prioritized over the extreme precision of more complex methods like gas chromatography.

The global Alcohol Refractometers market size was estimated at USD 56.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
