## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alcohol-Soluble Quantum Dots competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alcohol-soluble quantum dots (QDs) are colloidal quantum dots whose surface ligands have been modified to allow them to be stably dispersed in alcohol solvents (such as ethanol, isopropanol, and butanol). Their core is composed of semiconductor nanocrystals, with common materials including CdSe, InP, PbS, and perovskite. Alcohol-soluble systems offer advantages such as low toxicity, volatility, and suitability for inkjet printing. The product is priced at approximately \$300 per gram, with global sales of approximately 527 kilograms. The upstream of the alcohol-soluble quantum dot industry chain includes suppliers of semiconductor precursors (such as Cd, In, and Pb), high-purity alcohol solvents and surface ligands, as well as manufacturers of nanoreactors and dispersion equipment. Downstream sectors include MicroLED and QLED display manufacturers, optoelectronic device developers, and research institutions. This product is rapidly transitioning to cadmium-free, environmentally friendly systems (such as InP and perovskite) and driving deep integration of inkjet printing and patterning processes, while continuous breakthroughs are being made in high-concentration, high-stability alcohol-soluble systems and low-temperature processes for flexible electronics. The overall gross profit margin remained between 35% and 55%, demonstrating strong profitability and potential for technological evolution.

The global Alcohol-Soluble Quantum Dots market size was estimated at USD 158.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
