Report Overview

ALD (Atomic Layer Deposition) CVD (Chemical Vapor Deposition) precursors are specialized chemical compounds used in thin-film deposition processes to create high-purity, uniform coatings on substrates at the atomic level. These precursors are critical in semiconductor manufacturing, advanced electronics, and optoelectronic applications, where precise film thickness and composition are essential. They typically include organometallic compounds, metal halides, or metalorganic sources that react under controlled conditions to deposit materials such as oxides, nitrides, or metals. The performance of ALD and CVD processes heavily depends on precursor properties like volatility, thermal stability, and reactivity, making the selection and development of these chemicals crucial for achieving desired film characteristics in cutting-edge technologies.
