Abstracts

Aldehyde tanning agents are synthetic organic compounds, primarily glutaraldehyde and oxazolidine derivatives, used in the leather processing industry to convert raw animal hides into stable, non-putrescible materials through cross-linking collagen fibers. These agents are valued for producing leather with specific properties such as high hydrothermal stability, light color, softness, and resistance to washing, making them particularly suitable for apparel, automotive upholstery, and specialty leather goods. Their application spans both pre-tanning and main tanning stages, often in combination with other tanning materials like chrome or vegetable tannins to achieve desired characteristics while addressing environmental concerns associated with traditional chrome tanning, such as chromium pollution.

The global Aldehyde Tanning Agents market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
