Abstracts

Alfuzosin is a medication of the α_1 blocker class. It is used to treat benign prostatic hyperplasia (BPH). Alfuzosin is a medication primarily used to treat the symptoms of benign prostatic hyperplasia (BPH), a condition where the prostate gland enlarges and causes urinary difficulties. It belongs to a class of drugs called alpha-adrenergic blockers, which relax the muscles in the prostate and bladder neck, allowing for improved urine flow. Benign prostatic hyperplasia is a common condition, especially among older men. The increasing aging population contributes to a higher demand for medications like alfuzosin that effectively manage BPH symptoms. As awareness about BPH and its symptoms grows, more individuals seek medical help and treatment options. This drives the demand for medications like alfuzosin. Technological advancements, improved diagnostics, and enhanced treatment options have led to better detection and management of BPH, resulting in increased adoption of medications like alfuzosin. While alfuzosin is effective, there are other medications available for managing BPH symptoms. Competition among different medications in the market can drive the innovation and marketing efforts of manufacturers, resulting in increased demand for alfuzosin. Higher healthcare expenditure and accessibility to healthcare facilities in many regions further contribute to the growth of the alfuzosin market.

The global Alfuzosin market size was estimated at USD 94.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
