Abstracts

Alginate gel is a gel-like substance made from a mixture of alginate and water. Alginate is a natural polysaccharide, usually extracted from seaweed, with good biocompatibility and biodegradability. The mechanism by which it forms a gel in water involves the interaction between calcium ions and alginate molecules, forming a three-dimensional network structure. Alginate gels are often used as biomaterials in the biomedical field for applications such as cell culture, tissue engineering, drug delivery, and bioprinting. The development of the alginate gel market is inseparable from the application of alginate in many fields.
