Report Overview

Alginate medical dressing is a wound care product made from plant fibers extracted from natural seaweed and processed through a series of treatments. After the alginate medical dressing contacts the wound exudate, the sodium ions in the exudate exchange with the calcium ions in the alginate, so that part of the alginate fiber is gelled and calcium ions are released, forming a wetness between the wound and the dressing. The gel protective layer provides a good moist healing environment and has a certain auxiliary hemostatic effect.
