Abstracts

Aliphatic diisocyanates are a class of organic compounds characterized by two isocyanate (-NCO) functional groups attached to an aliphatic or cycloaliphatic carbon chain, distinguishing them from aromatic diisocyanates which contain benzene rings. These compounds serve as critical building blocks in polyurethane chemistry, where they react with polyols to form polymers with enhanced properties such as light stability, resistance to yellowing, and durability against environmental degradation. Key examples include hexamethylene diisocyanate (HDI), isophorone diisocyanate (IPDI), and hydrogenated methylene diphenyl diisocyanate (H12MDI), which are widely utilized in high-performance coatings, adhesives, sealants, elastomers, and other specialized applications where color retention and weatherability are paramount.

The global Aliphatic Diisocyanates market size was estimated at USD 5800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
