## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Aliphatic Polyketone Pure Resin competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global production of pure aliphatic polyketone resin reached 22,000 tons in 2024, with an average selling price of US\$4,837 per ton. Aliphatic polyketone (POK) resin is a high-performance thermoplastic polymer primarily produced by alternating copolymerization of carbon monoxide and olefins (such as ethylene and propylene), forming a linear crystalline polymer. Its structural characteristic lies in its aromatic-free chain structure, which allows for a certain degree of chain mobility, resulting in unique properties in certain areas. It is primarily used in engineering plastics applications such as injection molding and extrusion, such as in the manufacture of automotive parts, electronic and electrical housings, and mechanical components. The core raw materials for POK synthesis are carbon monoxide (a byproduct of tempering) and  $\alpha$ -olefins (ethylene and propylene). Domestic integrated tempering and chemical production bases (such as Baowu and Shenghong) already have low-cost CO resources, but high-purity  $\alpha$ -olefins still rely on imports for over 60%, creating a current cost bottleneck.

The global Aliphatic Polyketone Pure Resin market size was estimated at USD 108.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
