Abstracts

Aliphatic water reducers are high-performance chemical admixtures used in concrete to enhance workability and reduce water content without compromising the strength or durability of the final product; these compounds, typically derived from polycarboxylate ether (PCE) or sulfonated melamine formaldehyde (SMF) chemistries, function by dispersing cement particles more effectively, allowing for lower water-to-cement ratios, improved slump retention, and reduced segregation or bleeding, making them essential in modern construction for producing high-strength, durable, and sustainable concrete structures.

The global Aliphatic Water Reducer market size was estimated at USD 4600.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
