Abstracts

Aliskiren hemifumarate is a direct renin inhibitor used primarily in the treatment of hypertension, functioning by selectively inhibiting the enzyme renin at the beginning of the renin-angiotensin-aldosterone system (RAAS), thereby reducing blood pressure; it is the first orally active, non-peptide renin inhibitor approved for clinical use and is often marketed under brand names such as Tekturna and Rasilez. The market for aliskiren hemifumarate has been shaped by its specific mechanism of action, which differentiates it from other antihypertensive classes like ACE inhibitors, ARBs, or calcium channel blockers, though its adoption has been moderated by clinical guidelines and safety considerations, particularly following concerns over adverse effects when used in combination with ACE inhibitors or ARBs in certain patient populations. Geographically, its sales and regulatory approval status vary, with significant presence in North America, Europe, and parts of Asia, though patent expirations in key markets have led to increased generic competition, influencing pricing and market dynamics. The overall demand is driven by the global burden of hypertension, growing aging populations, and increased awareness of cardiovascular risk management, though the product's market share remains niche compared to more established antihypertensive therapies due to a combination of factors including cost, formulary restrictions, and evolving treatment algorithms favoring combination therapies or newer drug classes with improved safety profiles.

The global Aliskiren Hemifumarate market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.75% during the forecast period.
