Abstracts

Alkali free glass fibers, also known as E-glass fibers, are a type of synthetic fiber composed primarily of alumina-calcium-borosilicate glass, specifically engineered to contain less than 1% alkali oxides by weight; this chemical composition significantly enhances their electrical insulation properties, mechanical strength, and resistance to water and chemical corrosion compared to standard glass fibers. These fibers are typically produced through a continuous filament drawing process from molten glass and are most commonly used as reinforcement materials in composites for industries requiring high performance, such as aerospace, automotive, electronics, wind energy, and construction, where their non-conductive nature and durability under stress are critical.

The global Alkali Free Glass Fibers market size was estimated at USD 2113.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
