Abstracts

Alkali free glass substrate is a specialized type of borosilicate glass engineered to eliminate alkali metal oxides?such as sodium and potassium?from its composition, a critical feature that prevents ionic contamination and ensures superior electrical insulation, thermal stability, and chemical durability. This substrate plays an indispensable role as a foundational material in high-performance electronic and optoelectronic devices, including thin-film transistors (TFTs) in displays, photovoltaic cells, and various semiconductor applications where minimal thermal expansion, high transparency, and resistance to thermal shock are essential. Its production involves advanced melting and forming technologies to achieve the precise flatness, smoothness, and dimensional stability required by modern manufacturing processes, making it a key enabler of technologies such as LCDs, OLEDs, and advanced sensors.

The global Alkali Free Glass Substrate market size was estimated at USD 1045.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
