Abstracts

Alkaline electrolysis systems (AES) are electrochemical devices that utilize a liquid alkaline electrolyte—typically potassium hydroxide (KOH) or sodium hydroxide (NaOH)—to split water into hydrogen and oxygen gases through the application of an electric current, distinguished by their use of a porous diaphragm to separate the two half-cells and prevent gas mixing while allowing ion conduction. These systems operate at moderate temperatures (typically 60–80°C) and pressures, and are characterized by their relatively mature technology, robust construction with nickel-based electrodes, and comparatively lower capital costs, making them a well-established method for large-scale, industrial hydrogen production, particularly in applications where high purity hydrogen is required for chemical synthesis, refining, or energy storage, though they face competition from emerging technologies like proton exchange membrane (PEM) and solid oxide electrolysis cells (SOEC) which offer advantages in terms of operational flexibility and efficiency under variable load conditions.

The global Alkaline Electrolysis System market size was estimated at USD 3562.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 21.65% during the forecast period.
