Abstracts

Enzymes have long been used as alternatives to chemicals to improve the efficiency and cost-effectiveness of a wide range of industrial systems and processes. Alkaline proteases also known as basic proteases are a group of enzymes used primarily as additives in detergents and are active in a neutral to alkaline pH range. Most of the alkaline proteases have an optimal pH of around pH 10 with an isoelectric point of around pH 9. These are produced by alkalophilic micro-organisms and can resist extreme alkaline environments produced by a wide range of alkalophilic microorganisms. These are obtained from various microbial sources such as fungi, bacteria and certain yeasts. The enzymes demonstrate high stability and resistance to proteolytic hydrolysis owing to their high degree of cross-linking to hydrogen bonds, disulphide bonds, and hydrophobic interactions. They are stable in association with chelating agents and perbonates. Alkaline protease enzymes demonstrate high stability and resistance to proteolytic hydrolysis, owing to their high degree of cross-linking to hydrogen bonds, disulphide bonds, and hydrophobic interactions. They are stable in association with chelating agents and perbonates. Developments in field of protein engineering coupled with development of industrial enzymes is expected to create substantial demand for industry players in artificial proteases market.
