## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alkyl Polyglycoside (APG) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alkyl Polyglycoside (APG) is a mild nonionic surfactant, which is produced by dehydration of natural renewable resources fatty alcohol and glucose under acidic catalyst. It has good biodegradability, is beneficial to environmental protection, and is internationally recognized as the first choice of "green" functional surfactant. It has many advantages such as rich and delicate foam, good foam stability, strong compatibility, obvious synergistic effect, strong broad-spectrum antibacterial activity, strong alkali resistance and salt resistance. In 2024, global Alkyl Polyglycoside (APG) production reached approximately 473 K MT, with an average global market price of around US\$ 1511 per MT. The Alkyl Polyglycoside (APG) market is primarily driven by the global shift toward bio-based, "green" surfactants in home care, personal care, and institutional & industrial cleaning. Brands want products that are plant-derived, sulfate-free, mild to skin and eyes, and easily biodegradable, and APGs tick all of those boxes because they are made from renewable glucose and fatty alcohols, have low toxicity, and work well across a wide pH range. On top of that, tightening environmental and safety regulations on ethoxylated and nonylphenol surfactants, plus eco-label schemes and retailer sustainability scorecards, are pushing formulators in laundry detergents, dishwashing liquids, shampoos, body washes, baby products, and hard-surface cleaners to increase APG usage; additional, smaller but growing demand comes from agrochemical formulations, metalworking fluids, oilfield chemicals, and other industrial applications that need strong wetting and good compatibility with other ingredients. On the upstream side, APG producers sit at the intersection of agricultural and oleochemical (and, in some cases, petrochemical) markets. The carbohydrate side

is typically based on glucose from starch or sugar (corn, wheat, cassava, potatoes, sugarcane, etc.), so APG economics are directly exposed to crop yields, weather events, fertilizer and energy costs, and policy shifts that influence how much sugar and starch flow into food, feed, and biofuels; supply tightness in any of these chains can lift glucose prices and squeeze APG margins. The fatty-alcohol side is usually based on natural oils such as palm and palm kernel (and sometimes coconut), linking APG feedstock costs to vegetable-oil cycles, plantation productivity, sustainability and deforestation pressures, and export policies in key producing countries; where fatty alcohols are sourced from petrochemical routes, crude-oil and ethylene price swings, capacity additions in Asia, and refinery operating rates become important. Around these core streams, APG producers also depend on catalysts, process auxiliaries, and specialized glycosidation equipment, and have been investing in process optimization (e.g., yield improvements, lower alcohol-to-glucose ratios, energy efficiency) to stabilize costs in the face of raw-material volatility. The APG industry generally enjoys mid- to high-teens gross profit margins overall, with premium personal-care grades sometimes approaching about 20% but vulnerable to a few percentage points of compression during spikes in sugar or fatty-alcohol prices.

The global Alkyl Polyglycoside (APG) market size was estimated at USD 715.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.70% during the forecast period.
