Abstracts

Alkylate petrol is made of gaseous hydrocarbons found in fossil fuels: these are a kind of vapour or gas that occurs when refining oil. This process is called alkylation, and involves combining excess gases from the distillation of crude oil and from the cracking plant, resulting in a liquid alkylate. Some additional components are then mixed in, resulting in the finished fuel. For a long time, alkylate has been used as a core ingredient in the global market as a refined oil blender, and it is rarely made into alkylate gasoline. Restricted by European emission regulations, people prefer diesel engines. Therefore, Alkylate's demand for development in this field has weakened, resulting in abundant raw materials in the European market. The blending volume fraction of alkylate is critical to meet RVP, aromatics, sulfur, and olefins regulations. Europe produces an excess of alkylate and exports to other regions, mainly North America. Therefore, as a high quality and environmentally friendly fuel for small gasoline machinery, alkylate gasoline has great potential for development, especially in the current power tools facing the problem of insufficient battery life and low power. The rapid development of electric tools in global market will be the biggest factor hindering the development of alkylate gasoline. At the same time, the high price increases the cost of downstream use, which is also one of the main factors restricting the wide-scale promotion of this product.

The global Alkylate Petrol market size was estimated at USD 471.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
