Report Overview

All-In-One motor drive is a chip integrated with CMOS control circuit and DMOS power device, which can be used with the main processor, motor and incremental encoder to form a complete motion control system. It can be used to drive inductive loads such as DC motors, stepper motors and relays. The motor driver chip is controlled by standard TTL logic level signal, with two enabling control terminals, which allow or forbid the device to work without the influence of input signals. There is a logic power input terminal, which enables the internal logic circuit to work under low voltage. Can be connected to the external detection resistance, the change of the feedback to the control circuit.
