Abstracts

All Trans Retinoic Acid (ATRA), also known as tretinoin, is a derivative of vitamin A and functions as a potent retinoid with significant biological activity, primarily binding to retinoic acid receptors (RARs) to regulate gene expression involved in cell proliferation, differentiation, and apoptosis. It is widely utilized in both therapeutic and cosmetic applications, most notably as a first-line treatment for acute promyelocytic leukemia (APL) due to its ability to induce differentiation of malignant promyelocytes into mature granulocytes, and topically in dermatology for conditions such as acne vulgaris, photoaging, and hyperpigmentation by promoting skin cell turnover and collagen production. Its mechanism of action, clinical efficacy, and established safety profile under medical supervision have solidified its role across oncology and dermatology markets, with ongoing research exploring expanded indications in other cancers and inflammatory skin disorders.

The global All Trans Retinoic Acid market size was estimated at USD 422.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
