Abstracts

Alloy cast balls, especially low chromium alloy cast balls, are an important component of industrial wear-resistant materials and are widely used in crushing and grinding systems in industries such as mining, cement, and power. Low chromium alloy cast balls are wear-resistant materials mainly composed of low chromium alloys. Compared to traditional high chromium alloys, low chromium alloys have a cost advantage while maintaining good wear resistance and certain impact resistance. These materials usually contain appropriate amounts of alloying elements such as chromium, molybdenum, manganese, etc. Through precise proportioning and heat treatment processes, their microstructure is optimized, thereby improving the toughness and fracture resistance of the material while ensuring hardness. Specifically, the chromium element in low chromium alloys can effectively improve the material's corrosion resistance and hardness, while the addition of molybdenum and manganese further enhances the material's wear resistance and thermal stability.

The global Alloy Cast Ball market size was estimated at USD 1439.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
