Abstracts

Alloy sputtering targets are specialized materials used in physical vapor deposition (PVD) processes, primarily in thin-film coating applications across industries such as semiconductors, electronics, optics, and solar panels. These targets consist of precisely formulated metallic alloys?such as aluminum-copper, titanium-tungsten, or cobalt-chromium?which are bombarded with ions in a vacuum chamber, causing atoms to be ejected and deposited as thin, uniform films onto substrates. The composition, purity, density, and microstructure of these targets are critical, as they directly influence the functional properties?like conductivity, reflectivity, corrosion resistance, or adhesion?of the resulting coatings in advanced manufacturing processes.

The global Alloy Sputtering Targets market size was estimated at USD 1265.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
