Report Overview:

Metal powder refers to a group of metal particles with a size less than 1mm, including single metal powder, alloy powder and certain refractory compound powders with metallic properties, and is the main raw material for powder metallurgy, metal injection molding, additive manufacturing.

Alloy steel is steel that is alloyed with a variety of elements to improve its mechanical properties. Common alloyants include manganese (the most common one), nickel, chromium, molybdenum, vanadium, silicon, and boron. Less common alloyants include aluminium, cobalt, copper, cerium, niobium, titanium, tungsten, tin, zinc, lead, and zirconium.

Alloy Steel Powder, is metal powder made from alloy steel, and the carbon content of iron powder is between 0.02% and 2.11%. There are two main manufacturing processes for alloy steel powder, such as atomized powder and reduced powder. Due to the good coactivity, high purity and high compressibility of atomized powder, it will have a huge market potential. Alloy steel powder is widely used in automobile, machinery, chemical industry, magnetic materials and others.

With the continuous improvement of powder metallurgy technology, the application field of powder metallurgy products is continuously expanded to the high-end market. With the rapid development of new energy vehicles, photovoltaics, wind power, energy storage, aerospace, communications, medical care and other emerging fields, the demand for customized and personalized new materials and components with high performance and low cost has increased significantly. The advancement of powder

metallurgy technology can help the large-scale production of low-end homogeneous products to upgrade to the large-scale production of high-end customized products.

The Global Alloy Steel Powder Market Size was estimated at USD 3499.19 million in 2023 and is projected to reach USD 3940.66 million by 2029, exhibiting a CAGR of 2.00% during the forecast period.
