Abstracts

Allylamines antifungal drugs are a class of drugs that exert antifungal effects by specifically inhibiting squalene epoxidase (SE) in the ergosterol synthesis pathway of fungal cell membranes. These drugs have allylamine groups in their chemical structures, which inhibit SE and block the conversion of squalene to 2,3-oxidized squalene, leading to squalene accumulation and ergosterol deficiency in fungal cells. This dual effect not only destroys the structural and functional integrity of fungal cell membranes, but also causes a large accumulation of squalene inside the cells, resulting in toxicity and ultimately leading to fungal cell death. These drugs have relatively low toxicity to human cells and good selectivity. Due to the advantageous position in the treatment of superficial fungal infections, allylamines antifungal drugs have maintained a stable market share and growth potential in recent years. The main driving factors are the rising incidence rate of fungal infection, the improvement of patients' treatment awareness, product innovation and dosage form improvement, brand marketing and channel expansion. The representative drug terbinafine has become one of the gold standard drugs for treating superficial fungal infections, especially onychomycosis, worldwide. Naletifen and Butinifen are also important members of the allylamine family, mainly used for topical treatment. The market competition is fierce, with companies such as Pfizer, Novartis, Gilead Sciences competing in product quality, efficacy, price, and other aspects to compete for market share. Original drug brands usually have a high level of popularity, but their prices are also relatively high; However, domestic enterprises such as Qilu Pharmaceutical and Xiuzheng Pharmaceutical Group attract consumers with price advantages. With the continuous advancement of pharmaceutical research and development technology, more new types of allylamines antifungal drugs may emerge in the future, which may improve and optimize their efficacy, safety, and administration methods. Some studies and clinical trials have begun to explore the potential application of allylamines antifungal drugs in the treatment of deep fungal

infections. If a breakthrough is made, it will further expand the market space. In addition, the application of this type of drugs in other fields such as cosmetic additives also needs further development. Governments around the world are continuously strengthening their regulatory efforts and strictly regulating the production, sales, and use of allylamines antifungal drugs. This will help improve the concentration and competitiveness of the entire market, and promote the healthy development of the industry.

The global Allylamines Antifungal Drugs market size was estimated at USD 5470.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
