Abstracts

Alpha fetaprotein (AFP) testing is a diagnostic blood test primarily used to measure levels of alpha-fetoprotein, a protein normally produced by the fetal liver and yolk sac during pregnancy, with elevated or decreased levels in maternal serum serving as a screening marker for fetal abnormalities such as neural tube defects or chromosomal disorders like Down syndrome; in oncology, AFP functions as a tumor marker, with persistently high levels in non-pregnant adults strongly associated with certain malignancies, particularly hepatocellular carcinoma (HCC) and germ cell tumors, making it a critical tool for diagnosis, monitoring treatment response, and detecting recurrence in at-risk populations, including individuals with chronic liver disease or a history of certain cancers. The global AFP testing market is driven by increasing incidence of liver cancer, rising awareness of prenatal screening, advancements in immunoassay technologies, and growing healthcare expenditure in emerging economies, though it faces challenges such as the variable specificity of AFP as a biomarker, competition from more precise diagnostic alternatives like imaging techniques and other molecular markers, and regulatory hurdles in different regions.

The global Alpha Fetaprotein Testing market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
