Abstracts

According to the different structure of Alpha-phase Nucleating Agent, it can be divided into inorganic, organic and macromolecular. Inorganic nucleating agents are mainly nucleating agents developed in the early stage such as talc, calcium oxide and mica. They are cheap and easy to obtain, but the transparency and surface gloss of the products are poor. Organic nucleating agents are mainly carboxylate metal salts, phosphate metal salts and sorbitol benzylidene derivatives, among which sorbitol benzylidene derivatives are the most mature nucleating agents at present, with excellent performance and low price. Polymer nucleating agents are mainly high melting point polymeric nucleating agents, such as polyvinylcyclohexane and polyvinylpentane. A nucleating agent is an extensively used additive in polymer processing, aimed at facilitating the formation of crystalline structures. With the expanding applications of polymer materials such as plastics and rubber across various industries, the demand for enhancing physical, aesthetic, and processing properties of materials has been on the rise. Nucleating agents work by introducing minuscule crystal nuclei into polymers, effectively promoting crystal formation and growth, thereby enhancing materials' crystalline performance and overall properties. In the market, driven by the continuous emergence of new materials, there is a steady growth in the demand for nucleating agents. These agents find utility not only in improving transparency, toughness, and strength of plastic products but also play a vital role in fields like textiles and electronics, driving material innovation and expanding the scope of application areas.

The global Alpha-phase Nucleating Agent market size was estimated at USD 270.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
