Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Alt-Azimuth Telescope Mount competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Alt-Azimuth telescope mount is a telescope mounting structure that uses two axes of rotation, horizontal (azimuth) and vertical (altitude), to achieve celestial body tracking and positioning. Its design principle is similar to that of a camera tripod. Users can quickly align the telescope with the target by adjusting the horizontal and vertical angles respectively. Alt-Azimuth mounts are simple in structure, low in cost, and intuitive to operate. They are widely used in entry-level astronomical telescopes, ground-based observation equipment, and some large radio telescope systems. Although complex calculations are required to achieve two-axis coordinated compensation during celestial body tracking (especially in long-term tracking and photography, it is not as efficient as the equatorial type), with the development of automation and computational control technology, modern electric Alt-Azimuth mounts can achieve high-precision tracking and have become one of the important supporting structures for high-performance telescope systems (such as VLT or LSST).

The global Alt-Azimuth Telescope Mount market size was estimated at USD 92.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
